# The “What”

This project is about :

**Wearable devices with  
health and safety alarm system**

**Monitoring**

**Warning**

**Alert**

## Danger caused by abnormal body indicators

- body temperature
- heart rate
- blood oxygen concentration
- ...

## Danger caused by physical injury

- falls
- accident
- ...

**Deep learning**

**Speech recognition model**

Optional:

- Warning when pass areas where accidents frequently occur
- Predict the risk of traffic accidents in real time and inform

Machine Learning

Google Map

# Overall Solutions

a hospitalized patient

an elderly living alone

# Sensor Data Analysis

- Measure heart rate & blood oxygen levels
- Send and receive body indicators via RabbitMQ
- Make an emergency call and send SMS alert when an accident occurs
- Encrypt data for privacy

accidentally falling

call for help or hit the ground

# Abnormal Sound Recognition

- Acquire the environmental sounds actively
- Offline ML model in the wearable device
- Set up a vocal order to prevent hijacking
- Open-source solution in the Github instead of native implementations

RabbitMQ™

python™

Microsoft  
Azure

PostgreSQL

Vue.js

# Technical Implementation

Abnormal Body indicator

Speech Recognition

Road Traffic Accident Prediction

# Speech Recognition

## RNN

A recurrent neural network (RNN) connections between nodes form a directed graph along a temporal sequence. This allows it to exhibit temporal dynamic behavior.

## LSTM

LSTM is suitable for processing and predicting important events with very long intervals and delays in time series

## CTC

Connectionist Temporal Classification (CTC) is a method widely used in speech recognition to solve the problem of voice frame alignment caused by different people speaking speeds.

## Data set

- English:  
FreeSpokenDigits,  
VCTK corpus
- Chinese:  
Free ST Chinese Mandarin  
Corpus

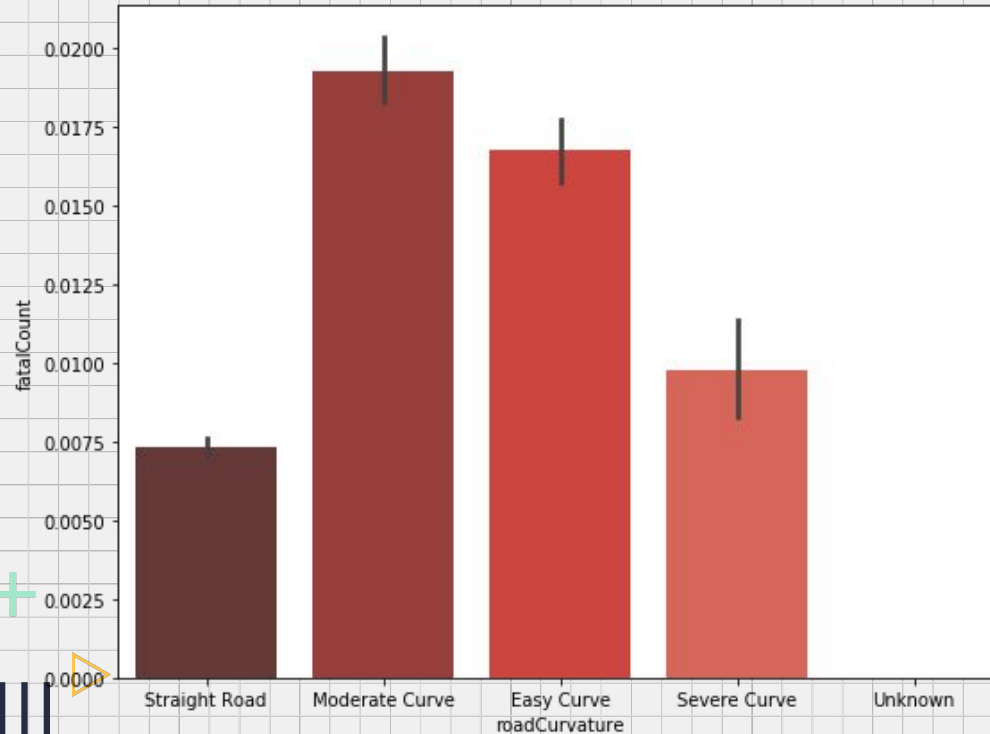

# Road Traffic Accident Prediction

The World Health Organization(WHO) estimated that 1.25 million deaths were related to road traffic injuries in the year 2010.

Goal: Help users avoid potential dangers from the beginning

Use existing API to collect road curvature, speed limit, weather and a series of other data

# Design Considerations

## Step 1: Set Up

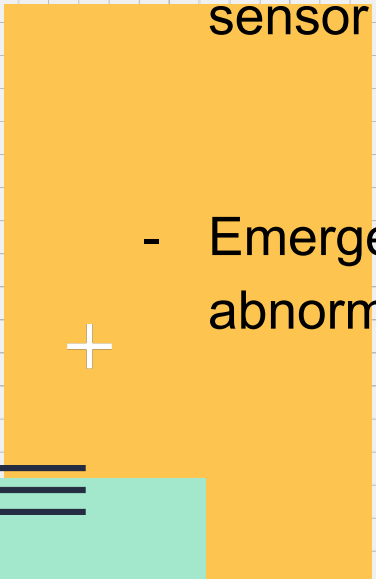

- Create a VM as a wearable device (IoT)
- Create a RabbitMQ Server (MQTT)
- Resources:

[https://github.com/singgel/mqtt\\_iot\\_push](https://github.com/singgel/mqtt_iot_push)

## Step 2: Sensor Simulation

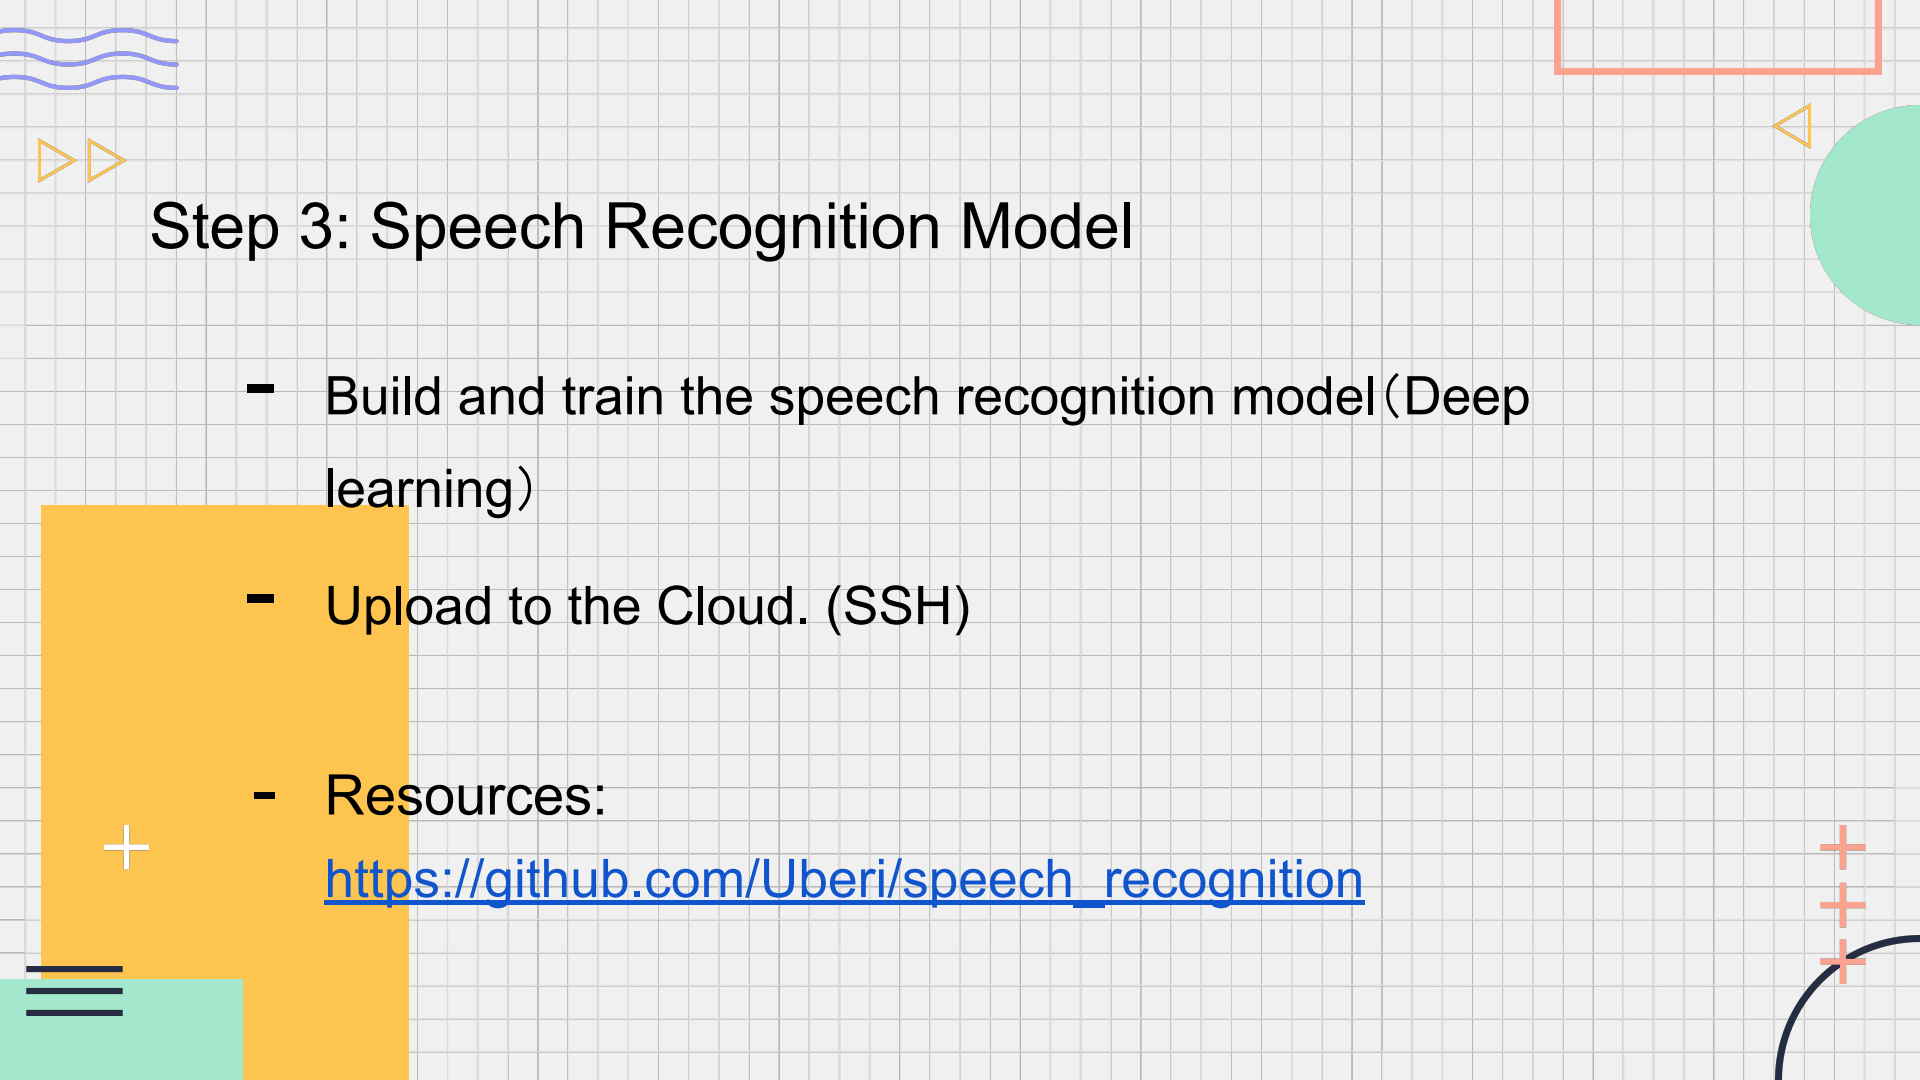

- Datas collected by the sensor

- 
- 
- Emergency or abnormal situation

- Python program

- Command line

## Step 3: Speech Recognition Model

- Build and train the speech recognition model (Deep learning)
- Upload to the Cloud. (SSH)
- Resources:  
[https://github.com/Uberi/speech\\_recognition](https://github.com/Uberi/speech_recognition)

## Step 4: Speech Recognition Simulation

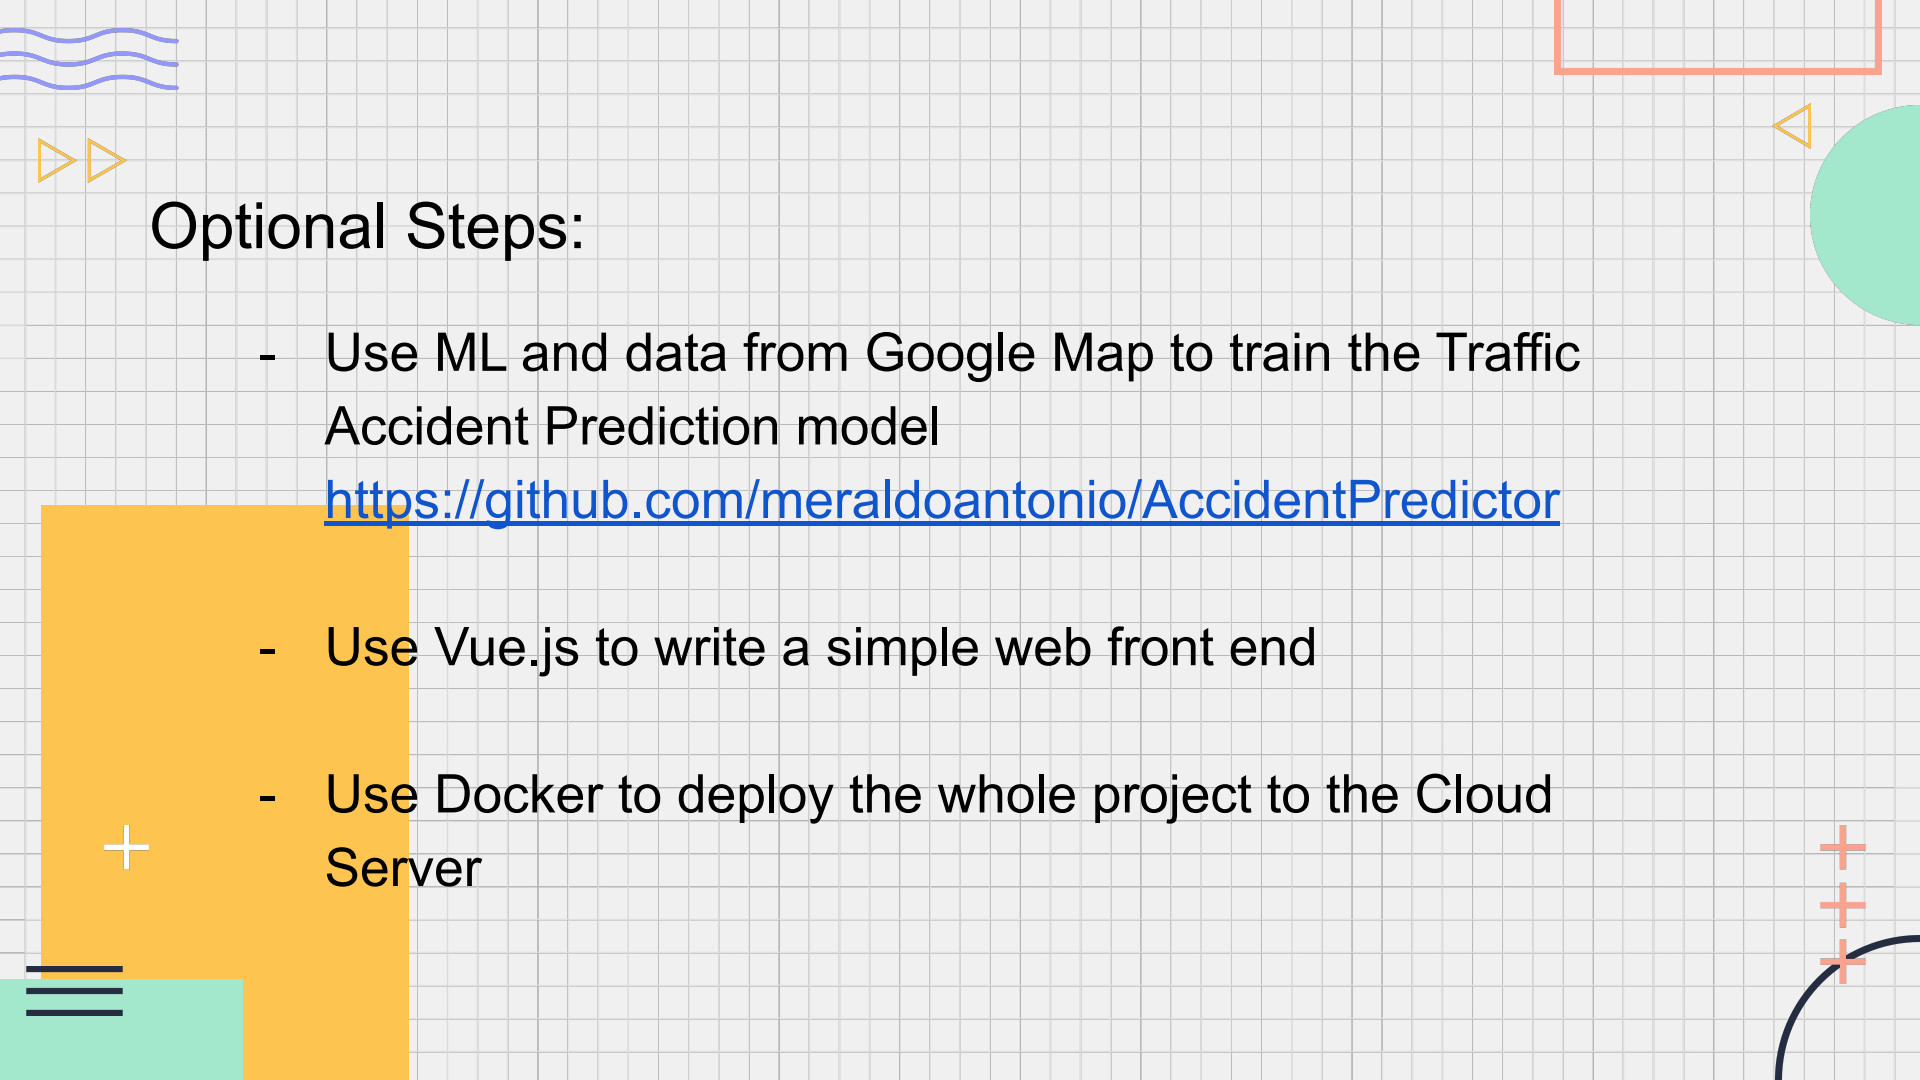

- Record the voices as the test case.

### Backup Plan

- Azure API: Microsoft Azure Speech
- 

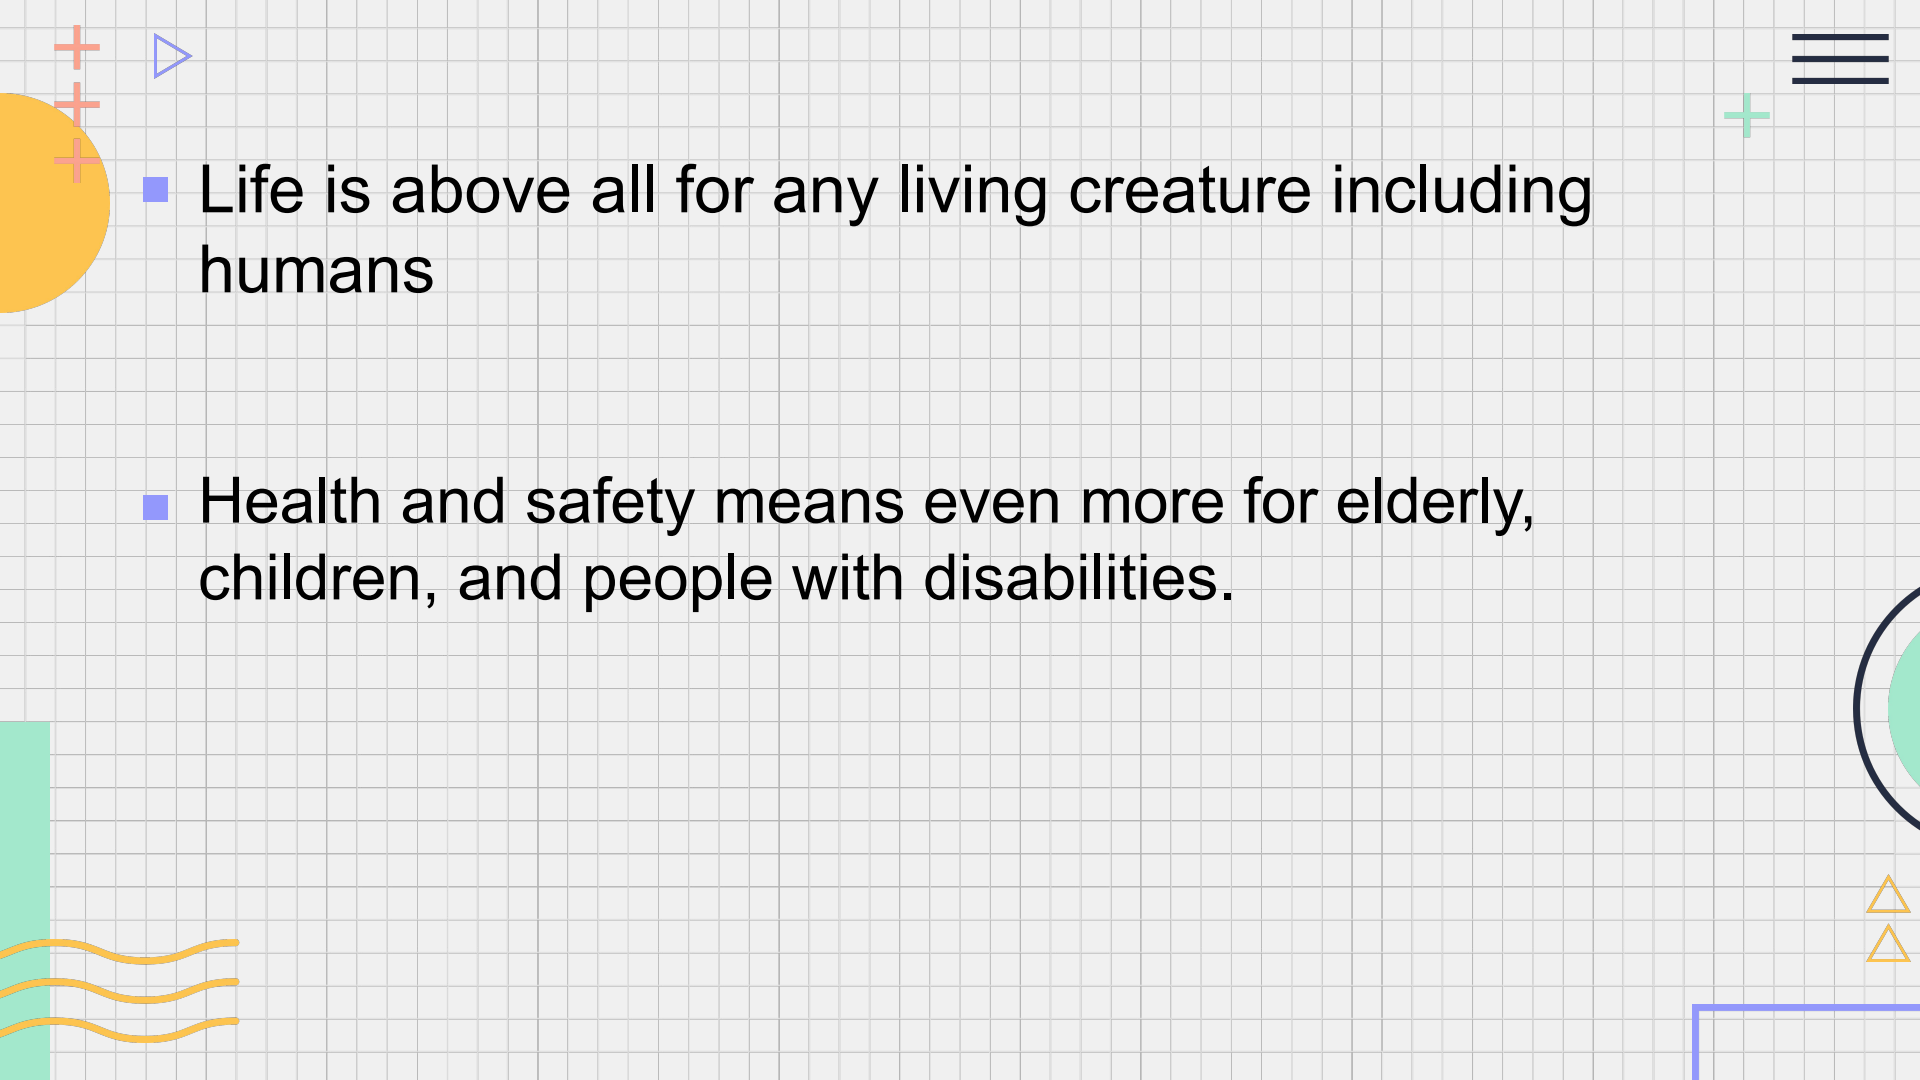

## Optional Steps:

- Use ML and data from Google Map to train the Traffic Accident Prediction model  
<https://github.com/meraldoantonio/AccidentPredictor>
- Use Vue.js to write a simple web front end
- Use Docker to deploy the whole project to the Cloud Server

# The “Why”

- 
- Life is above all for any living creature including humans
  - Health and safety means even more for elderly, children, and people with disabilities.

## Intelligence

Machine learning & Data analysis

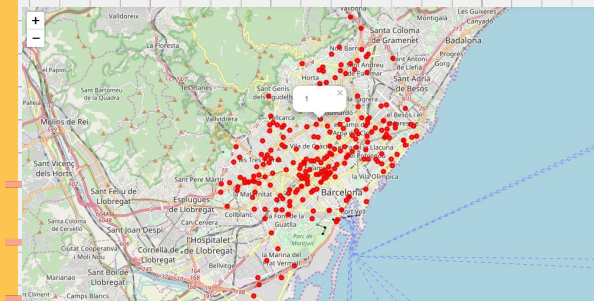

## Innovation

Abnormal sound recognition  
& Alert system

## Real-life

Personal and scale application

Thanks !
